**ZOSEM Features in Detail**
- Base Features 20
- Job Resource Routing & Classing Controls 19
- Virtual Storage Controls 20
- Tape Usage Controls 21
- System Command Controls 21
- End User JOB Execution Controls 24
- Program Name Execution Controls 25
- Print Output Extension Controls 22
- Device Allocation Controls 23
- Time Controls 24
- Dynamic STEPLIB insertion 24
- Dynamic TSO STEPLIB 28
- RACF Controls 25
- TSO Submitted JOB Controls 25
- WTO Controls 26
- TAPE Sharing Controls 26
- JCL Parameter Controls 26
- Job/Step Statistics 28
- HSM Optimization Controls 29
- DASD Allocation Controls & QuickPool 31
- HSM Reports 32
Management Summary

The cost of providing medium to large-scale z/OS Enterprise Server Environments can be anywhere between 15 million and 150 million dollars per year.

zosem makes it much easier for installations to manage these resources and to control how they are used.

zosem is an essential tool for maximizing the return on investment in z/OS technologies and for enabling management to achieve the on-going objectives of:

- Improving manageability
- Improving system throughput and service levels
- Reducing hardware costs
- Reducing software license costs
- Reducing HR costs

zosem can allow you to achieve total annual savings equivalent to its purchase cost. In fact, zosem can be cost justified with throughput improvements of as little as 1% - a small fraction of the potential throughput gains.

If you use HSM for DASD storage management, zosem may well be cost-justifiable by the HSM Optimization feature alone.

In addition, zosem is user friendly and can be used by both technical and operations staff alike.

zosem is installed at over 60 sites in the USA across a wide range of industry sectors.

zosem was voted IBM ISV Solution of the month for June 2001.
Benefits

Improving Manageability

zOSEM simplifies the task of managing z/OS complexes by:

Simplifying the Enforcement of Standards

zOSEM enables you to easily define, modify and enforce your installation standards and operating rules, without any programming effort on the part of your staff, simply by setting parameters via a user-friendly online interface. Changes can be applied dynamically or deferred to the next IPL.

Simplifying Software Upgrades

zOSEM can greatly reduce or even eliminate the need to re-work and re-test installation exits. zOSEM’s built in functions can typically replace 95% of locally developed system modifications and exits.

zOSEM also can avoid the need to make manual JCL changes and to IPL systems when implementing new versions of program products. Evaluation and testing of new software products is also easier.

Simplifying System and Data Center Consolidation

By reducing or even eliminating the need to retain in-house installation exits, zOSEM allows you to position systems prior to integrating their workloads. In addition to making the task of workload integration much easier, this also simplifies the processes of system build and rollout.

Providing a Dynamic Operating Environment

zOSEM provides the ability to dynamically change your operational environment to suit specific workload profiles. For example, you may define a set of standards and rules that are to be enforced during daytime online processing and a totally separate set that are to be enforced during the overnight batch period. Any mix of zOSEM controls can be activated and de-activated dynamically without the need for an IPL.
**Enhancing Storage Management**

*zOSEM* helps you to maintain error free migration and recall operations by providing extensive reports that allow your storage management personnel to quickly gain an insight into HSM operations.

**Facilitating Accounting & Charge-back**

*zOSEM* enables you to enhance your accounting and charge-back processes by allowing easy definition, validation and modification of accounting standards and account numbers. It can insert up to 32 characters of Job Accounting information into the catalogue for DFSMS managed datasets to be included by IDCAMS DCOLLECT when dataset information is collected for primary DASD, the MCDS and the BCDS for DFSMS/hsm environments.

**Improving Security & Integrity**

*zOSEM* enables you to improve your system’s overall security and integrity by ensuring users are authorized to access resources specified in job JCL parameters.

**Restricted Password Control**

*zOSEM* augments the limited capability of RACF’s SETROPTS to control the content of passwords. Restricted password control provides the following options:

- Prevent the use of the RACF USER ID anywhere in the password
- Require the use of a minimum number of alpha, numeric and/or special (#, @, $) characters in the password
- Prevent the use of the RACF User Name or segments of the name anywhere in the password.
- Allows the creation of a table of words, word fragments or masks that are to be excluded from the password.
**Improving System Throughput and Service Levels**

*zOSEM* controls contribute to improved system throughput and service levels.

### Improving System Throughput

*zOSEM* provides a range of features for improving system throughput by optimizing the utilization of system resources. These include facilities for improving your control over resources such as job classes, sysout classes, writers, virtual storage, dataspaces, hyperspaces and much more.

Dynamic job routing can also contribute to improved system throughput by routing important workloads to less congested processors or by routing non-production workloads (e.g. compiles etc.) to less critical processors.

*OSEM* job routing provides the ability to route jobs based upon a much granular set of criteria/job attributes than that provided by standard z/OS facilities.

*zOSEM* can automatically handle resource overruns (e.g. Job/Step CPU time, sysout lines/pages and wait times) without operator intervention being required, thus ensuring that workload processing continues to completion and avoiding expensive and time-consuming reruns.

*zOSEM* can also be used to reserve scarce hardware resources for specific jobs or a range of jobs ensuring that critical jobs run when they need to.

If you are using HSM for data migration, the use of *OSEM* recall optimization, prioritization, quick delete and early recall (done during JES2 Job conversion) features can also improve system throughput by drastically reducing or even removing HSM recall wait times.

### Ensuring Resource Availability

*zOSEM* enables you to ensure mission critical work receives the resources it needs when required and prevents misuse of resources by unauthorized users.

*zOSEM* can optionally prevent a Job from starting execution until all required datasets are available, resolving dataset name conflicts. This stops Jobs from waiting on an initiator when all the datasets are not available.
**Increasing System Availability**

*zOSEM* helps you to improve system availability by avoiding the need to IPL the system when modifying installation standards and rule definitions. In addition, *zOSEM* enables the dynamic refreshing of Supervisor Call (SVC) modules and RACF controls tables and exits.

**Improving Responsiveness**

*zOSEM* improves your responsiveness to user requirements by reducing the time needed to modify or define new rules and implement new versions of operating system software and program products.

**Reducing Hardware Costs**

*zOSEM* controls can help to reduce hardware costs by:

**Delaying CPU Upgrades**

Improvement gains in system throughput and the ability to offload specific workloads to less critical or less busy processors enables you to delay CPU upgrades.

Additionally, significant processor and I/O reduction can be achieved with the HSM Optimizer which provides a much higher level of granularity of control than that provided with the standard HSM product.

Less frequent processor upgrades also result in software license savings.

**Reducing the Number of Required Tape Devices**

*zOSEM* reduces your tape device requirements by enabling dynamic tape sharing between multiple non SYSPLEX z/OS LPARS. This reduces throughput delays for critical jobs due to tape drive contention and the use of manual procedures to move tape drives between the z/OS LPARS.

**Improving DASD Utilization**

*zOSEM* enables you to reduce DASD storage for first level archive space (i.e. Migration Level-1) in HSM environments. This means that DASD space can be used more effectively.

**Reducing the Number of Required Special Devices**

*zOSEM* allows you to reduce or avoid duplication of special hardware devices by dynamically routing jobs to processors where the devices are attached.
Reducing Software License Costs

zOSEM controls can help to reduce software license costs by:

Reducing Software License Requirements
The ability to dynamically route jobs via zOSEM using a very granular set of routing criteria makes it easier to restrict the licensing of software to specific processors.

Furthermore, the delaying of processor upgrades facilitated by improved system throughput and the more efficient utilization of system resources can postpone MIP-related increases in software licenses.

Facilitating Product Removal
zOSEM enables you to remove products such as CA-MIM ALLOC and BMC’s Mainview Auto Operator Tape share Facility by providing built in tape sharing facilities. This alone can justify its cost.

zOSEM enables you to remove products such as HSM Reporter and Easy HSM by providing extensive HSM reporting facilities.

Facilitating JES3 to JES2 Migration
zOSEM provides you with a migration path from JES3 to JES2 by including most of the workload routing functionality of JES3 eliminating the additional license cost for JES3 and the need for any JES3 supporting software.
**Reducing HR Costs**

zOSEM has the potential to significantly reduce the effort required to support z/OS systems, enabling scarce technical resources to be assigned to more strategic tasks.

**Reducing Effort for System Upgrades**

When undertaking System upgrades technical support effort can be significantly reduced, by minimizing the need to re-work, re-test exits and other System Modifications.

zOSEM also avoids you having to make manual JCL changes or to IPL systems when implementing new versions of program products. This is achieved through the dynamic insertion of STEPLIB entries during z/OS ATTACH processing. SVC modules can also be dynamically added, loaded and/or refreshed. Evaluation and testing of new software products is made easier and with less disruption.

**Reducing Effort for Exit Development and Maintenance**

The use of zOSEM Controls can significantly reduce or completely remove the need to develop and maintain in-house system code and exits. zOSEM’s built in functions can typically replace 95% of locally developed system modifications and exits.

**Increasing Automation of Storage Administration**

zOSEM provides enhancements to HSM processing that increase the level of automation and hence, reduce the need for human intervention.

**Facilitating JES3 to JES2 Migration**

Providing a migration path from JES3 to JES2. zOSEM provides equivalent job routing functionality but requires much less effort to support.
## Feature & Benefits Matrix

Cost Justification

By simplifying the management of z/OS resources and improving your control over how they are used, zOSEM enables you to achieve annual savings that are in excess of its purchase price.

If the cost of providing your z/OS resources is in the region of 10 million dollars per 1,000 MIPS annually, throughput improvements of as little as 1% will achieve this.

This is a small fraction of potential throughput gains with bottom line savings, being reflected in delayed hardware upgrades and avoidance of software license increases.

In fact, if you are using HSM it is likely that zOSEM, will be cost justified by the HSM Optimization feature alone.

Furthermore, the support costs (Project Time and personnel) for upgrading system software, consolidating data centers and building standard systems can be reduced by zOSEM. This is of particular significance if your business involves in-sourcing or out-sourcing services.

In addition to the major cost benefits mentioned above, zOSEM may be able to deliver additional savings, for example:

- If you are using CA-MIM ALLOC, the comparable zOSEM controls may well allow its removal with consequent savings in annual maintenance costs.

- If you are using products such as SAS, FILEAID, FOCUS or CA-Easytrieve, zOSEM routing controls may enable you to run these products on fewer processors or on smaller machines, again with consequent savings in MIPS related license and annual maintenance costs.

- Similarly, if you have need of specialized hardware zOSEM routing may reduce the number of devices needed.

- If you are using JES3, the comparable controls in zOSEM could allow you to move to JES2 with consequent savings on JES3 and JES3 support software costs.

- If you are currently maintaining your own controls and exits, the staff involved can be freed for other work.

- zOSEM can eliminate significant manual JCL changes for upgrades or new software packages.
Implementation, Support & Maintenance

Implementation

Trident Services staff will assist you to identify the most appropriate implementation strategy and will provide onsite support during the implementation. This will help to ensure that maximum benefit is derived from the product as early as possible and will also provide a valuable transfer of zOSEM-related skills and experience to your staff.

Support

Trident Services provides a 24/7/365 line for direct support.

Maintenance

Corrective maintenance to code will be provided for material malfunctions in order to bring zOSEM into conformity with the operating specifications for the most current version of the product. This will be in the form of one-off fixes for particular problems or a cumulative package of corrections for known problems provided between versions of the product.

New releases of the product that provide extensions, enhancements and other changes, including support for new releases of the operating system, are provided at no charge to licensees of the product.

New versions of the product that include major new functionality and support new versions of the operating system are released at regular intervals.
User References

zosem has users of the product across diverse industry sectors including banking and finance, retail, government, manufacturing, insurance, publishing and pharmaceuticals. Outsourcing companies also use zosem to consolidate systems and simplify software upgrades.

Below is a list of the principle reasons cited by customers for acquiring zosem, ranked in their order of importance.

- Standards Enforcement
- EXIT Removal and simplified upgrades
- Resource Routing
- HSM Optimization/Reporting
- System consolidation/Data Center mergers
- Tape Sharing
- Exit Management
- Job accounting/charge-back
- Software license reduction
- Automating Job Prioritization/Service Level Improvement
- LE/370 implementation
- JES3 to JES2 migration
- Parallel Sysplex and Data Sharing implementation
- Resource usage extensions

Sample User Comments:

Wachovia Bank
Wachovia is the fourth largest banking company in the U.S.

Quotes:

"...JES2 Upgrade Lag is Standard Operating Practice in OS/390 World"

"...one hurdle with system upgrades is the requirement to update not only the operating system, but also the Job Entry Subsystem (JES2)"

"...upgrading to OS/390 version 2.4 had gone smoothly, but JES2 upgrades are always more tricky"
“...JES2 upgrades have always followed six to twelve months behind operating system upgrades”

“...estimated that nearly six months of a system programmer’s time would be required to move from one version of the Job Entry System to the next”

“... enables us to keep our JES2 up to date with our operating system environments across eight production machines, plus four development environments, with only two systems programmers”

“...by limiting the use of software to a select number of processors, it is possible to reduce software maintenance bills significantly”

“...we have been able to eliminate our customized JES2 Source Code, eliminate our macro JES2 Macro changes and significantly pare down the total number of JES2 EXITs”

“...plus, we are able to keep our JES2 up-to-date with our operating system upgrades”

CITY AND COUNTY OF SAN FRANCISCO

The City and County of San Francisco provides multiple services to more than 2,500 end users. These include a court management system for the judiciary, resource management, accounting, standards and statistics for city hall, and a 911 emergency calling system for the police department. Quotes:

“...doing the upgrade would take an enormous amount of system programming time. Our MVS environment had many customized system exits that would need to be completely rewritten for a new environment”

“...based on our previous experience with the product, we knew it would save us three months of system programming time, at the very least”

“... the value of the zOSEM tool suite did not end with the migration. zOSEM also enabled the Department to simplify its environment by eliminating third party data mover software and to standardize on IBM’s own hierarchical storage management (HSM) platform”
MAJOR FOOD RETAILER

One of the world's largest food retailers operating over 1,500 stores in the United States and Canada. The System Technology Department provides services to over 5,000 end users throughout the organization. Quotes:

“...we were looking at three to four years to upgrade because of the man hours that would be required to implement standard exit points for the systems before we migrated to a vanilla environment”

“...vendor suggested to deploy zOSEM in order to eliminate from the project plan, the man hour allocations required for exit upgrades. Using zOSEM, no user exits were required, since the product provided the functions required by the applications running on the mainframe”

“...within three months, the project was already ahead of schedule”

“...the success of the three migrations provided the company with an application environment that has become a standard within the organization”

“...with zOSEM, the company realized a three to four year time savings across multiple migrations”

LARGE PAYMENT PROCESSING COMPANY

A large processor of payments for domestic and international users of credit, debit, commercial and private-label cards.

Quotes:

“...the product was installed in two hours and we were using it in five hours”

“...immediately saw that it was a great time saver. Fixing an exit mod didn’t require an assembler programmer; a junior systems programmer could do the work”

“...the product is now used in migrations and application program testing prior to migration”

“...the cost benefit argument was made as soon as we looked at what it would cost to do the work without zOSEM”

“...as a bonus, the zOSEM product not only helps to speed migration, but can also be put to use to improve application development and testing efforts and to aid in managing day-to-day operational tasks”
InfoCrossing (formerly MCRB SERVICE BUREAU)

MCRB Service Bureau in Chatsworth, CA. supports more than 100 customers with outsourced processing. Quote:

"...MCRB continues to use zOSEM to support customers involved in the upgrade and testing of systems. The product provides support for ‘The Mellon Bank Modifications’ that each customer has made to his existing Job Entry Subsystem (JES2) in a multiple LPAR environment”

UNISYS

The CCF Data Center within the Federal Systems Division of Unisys Corporation provides claims processing services for state and federal medical insurance. Quotes:

"...zOSEM was acquired a year ago to facilitate the integration of existing claims processing systems into the consolidated mainframe platform at the CCF Data Center”

"...we used the product to generate reports on performance and to identify EXIT points taken by coders who wrote the systems we were consolidating. Then we analyzed the exits and either revised them for use with the latest JES2 or retained the function using Extended Functions supported by zOSEM”

"...zOSEM created another important capability for Unisys: there is often confusion in consolidation scenarios. Different groups of people whose applications are being consolidated have different ways of doing things. We realized that zOSEM could be harnessed to help us to establish and enforce some control policies”

"...provides a way to enforce regions and job class rules that is pretty easy to set up with zOSEM and very reliable"
**zOSEM Features in Detail**

**Base Environment Manager**

**Management Summary**

The Base Environment Manager populates the most commonly used system installation exit points (i.e. z/OS, JES2, JES3, TSO, SMF, RACF, DFP, Allocation, SAF (Security Access Facility) and HSM) with its own parameter-driven functions and can be used to manage existing exit code or a combination of zOSEM’s built in functions.

The facilities provided by the Base Environment Manager allow you to dynamically activate, modify and de-activate system installation exists without the need to IPL the system and provides full recovery capability in the event of installation exit malfunction.

**Details**

The zOSEM Base Environment Manager enables you to have a standard operating environment, whether on a single processor or on multiple processors, by allowing the installation exit modules to exist outside of the operating system. The required controls can be implemented quickly and smoothly and reliability exposures, availability interruptions and system modification problems can also be avoided while maintaining a vanilla operating system.

Variations from the standard IBM-supplied environment, such as those provided by program products or user-written control functions, no longer require an IPL or to be applied by the System Modification Program Extended (SMP/E). Loading or reloading any of these exits can now be done via the zOSEM ISPF dialogue.

The Base Environment Manager provides dynamic loading and reloading of all supported z/OS Exits. Exit points can be enabled and disabled dynamically and where appropriate, limited to specific jobnames. In addition, the dynamic adding, loading and refreshing of Supervisor Call (SVC) modules and RACF control tables are also supported. This provides an installation with a Quality Assurance or testing environment not previously available.
Base Features

- Automatic Management of Exits with predefined names Allocation, DFP, HSM, ISPF, JES2, JES3, RACF, SMF, SAF and TSO
- Eliminates the need to IPL to refresh LPA modules that are managed by zOSEM Allocation, DFP, HSM, ISPF, JES2, JES3, RACF, SMF, SAF and TSO
- Error Recovery for Exit abends (ESTAE and FRR as appropriate)
- Backup Exit programs specified to automatically switch to if an Exit program abends
- Security Interface to an External Security Manager (e.g. RACF, CATOPSECRET, CA-ACF2) to allow access to zOSEM functions and Resources
- ISPF interface for Exit Management
- Query Interface to display Exit Status
- Up to 255 Independent Exit programs per exit point
- Jobname limiting for each Exit program
- Valid / Good Return code checking
- Disabling Return code checking (to remove an Exit program from execution)
- Default Return code
- TSO Notify support for Exit programs that abend
- Loading of Exits from LINKLIBs, JOBLIB, STEPLIB or private authorized load library
- SVC dumps for Exit program abends
- Loading of Exit programs in either CSA or ECSA depending on RMODE/AMODE addressability
- Dynamically Reload / Disable individual Exit programs
- Dynamically Reload zOSEM Controller Programs without an IPL

List of Exits Supported

- DFP Exits
- HSM Exits
- ISPF Installation Wide Exits
- JES2 and JES3 Exits
- RACF Exits
- System Management Facilities (SMF) Exits
- TSO/E Exits
- Security Access Facility (SAF) Exits
Online Interface

Allows you to:

- Enable or disable a particular Exit point
- Define active user exits and what those Exits are
- Set, enable or disable zOSEM Extended Functions (assuming that the exit point has optional functions)
- Define up to three jobname masks per exit to limit the effect of the associated user exit, if LIMIT checking is applicable to the Exit point
- Provide an optional description for each of the relevant user Exits which could be used to document the author and the date the user Exit was installed or modified

Job Resource Routing & Classing Controls

Management Summary

zOSEM Job Routing Controls allow you to define and enforce Job Routing rules between processors in a Sysplex, based upon user defined resource names and their availability.

Job Routing Controls enhance those provided as standard by JES2 and Workload Manager (WLM) to improve workload balancing and make better use of hardware resources in a Parallel Sysplex environment. Job Routing Controls can also be used to reduce or control software-licensing costs by routing jobs to processors or Defined Capacity LPARS (requires z/OS 1.4 or above) where products are licensed. Throughput is improved by routing jobs to processors where resources are available. Job throughput is improved as delays or re-runs due to resource unavailability are avoided. As controls are dynamic, effort for manually changing JCL is eliminated.

Details

Job Routing Controls provide the capability to select the z/OS images in a Multi Access Spool environment (MAS) where jobs will execute. Jobs can also be routed to other z/OS systems via dynamic insertion of NJE routing information.

Jobs can be routed to specific z/OS images in a MAS environment where the resources reside or where the installation manager requires them to execute. Routing may be controlled by statements placed within the job JCL containing zOSEM recognized parameters, or by specifying routing control information through the online interface.
There is a maximum of 127 routes per job. This is a combination of JCL statements and zOSEM Automated Routing.

This function is used to:

- Override the specified Job Class or Priority specified on the Job Card
- Assign an zOSEM Automated Resource for Job Routing
- Change the Workload Manager Service Class
- Change the requested NJE node
- Change the Workload Manager scheduling environment

**Based on the following parameters defined in the Job JCL:**

DDNAME(mask), Dataset Name (mask), Job Class, Job Name(mask), Program Name(mask), RACF Group, Unit Name(mask), Userid(mask), WLM Service Class, Program Execution Parm(mask), member name(mask) Submitting Job Name(mask), Submitting Program Name(mask) and Submitting Job Type (STC, TSU, JOB)

By converting any SCHENV=name JECL statement to an zOSEM Resource statement, zOSEM allows automatic conversion of Scheduling Environments to zOSEM Routes. This provides an easy method to move away from Workload Manager Scheduling Environments to the flexible and easily changed zOSEM Resource Routing. To facilitate implementation of zOSEM Job Routing, zOSEM can automatically change SYSAFF JECL statements to SYSAFF=ANY to avoid the need to remove system affinity statements from existing JCL.

**Virtual Storage Controls**

**Management Summary**

zOSEM Virtual Storage Controls allow you to define and enforce rules for the use of the different types of virtual storage allocations.

Eliminates JCL Changes for OS/390 upgrades or maintenance and prevents job failures due to virtual storage shortages and resulting wastage of CPU resources.

**Details**

zOSEM allows the installation to define up to 32 different defaults or overrides Virtual Storage Controls based on Jobclass, Jobname and Program Name including usage of:

- Region below the 16MB line
- Getmain below the line
- Region above the line
- Getmain above the line
- Hiperspace/Dataspace default size, total size, number per address space
- Above the Bar (z/OS in 64 bit mode only)
Virtual Storage Controls protect production jobs from storage related abnormal terminations (S106, S80A abends).

**Tape Usage Controls**

**zOSEM** Tape Usage Controls allow you to define and enforce rules that control the number of tape drive resources allocated to a job.

Manages scarce tape drive resources, controls hardware costs for tape drives, and helps meet service level objectives.

You can control tape usage by JOBCLASS specifying maximum Total Tapes and/or Maximum by type of tape (e.g. 3420, 3480, 3490, 3590 and 3490-VTS).

**System Command Controls**

**Management Summary**

**zOSEM** Command Controls allow you to define and enforce rules that control who can submit jobs containing JES2 and z/OS commands.

Protects the integrity of the system by preventing unauthorized changes to the status of system resources that may compromise the throughput of production/high priority jobs.

**Details**

**zOSEM** can be set to verify that users are authorized to submit jobs that contain operating system commands or JES2 commands. The user can be limited to specified commands only, all commands, or can be precluded from submitting jobs with any operating system or JES2 commands.

**End User Job Execution Controls**

**Management Summary**

**zOSEM** End User Execution Controls allow you to limit the number of jobs that can run concurrently in any one system or MAS based on the submitter’s USERID.

These controls prohibit End Users from executing excessive numbers of jobs simultaneously and limit excessive numbers of any job type from monopolizing processor resources or causing system degradation.
Details

Allows you to limit the number of jobs that can run concurrently in an SMF ID, an LPAR, a single MVS image, in a Multi Access Spool (MAS) or in an entire sysplex using up to 32 user defined rule sets based on:

- Userid
- Jobclass
- Jobname
- Time of day
- Day of week

Program Name Execution Controls

Management Summary

zOSEM Program Name Execution Controls allow you to limit the number of jobs that can run concurrently in any one system or MAS based on Program Name.

These controls prohibit Multiple CPU intensive Programs from monopolizing processor resources or causing system degradation.

Details

Allows you to limit the number of jobs that can run concurrently in an SMF ID, an LPAR, a single MVS image, in a Multi Access Spool (MAS) or in an entire Sysplex based on the Program Name.

Print Output Extension Controls

Management Summary

zOSEM SYSOUT Extension Controls allow the installation to define and enforce rules that govern the amount of output generated by batch jobs.

Improves throughput and service levels by preventing production failures due to exceeding output limits and controls CPU resources by avoiding re-runs. Prevents unauthorized jobs from generating large amounts of output and filling up spooling resources.
Details

Allow extensions for generated output for up to 32 user defined rule sets based on:

Jobname
Program Name
Job class
SYSOUT class values set in the JES2 Initialization parameters ESTLNCT, ESTPAGE and ESTBYTE
As defined by an external security system

SYSOUT Extension Controls protects Production Jobs from abnormal terminations due to exceeding limits for generated output (S722 Abends).

Device Allocation Controls

Management Summary

zOSEM Allocation Controls allow you to reserve specified device(s) for use by specified jobs.

Improves throughput and service levels by ensuring jobs needing these devices execute when required.

Details

Allows you to:

- Restrict device allocation and define how device unavailability is handled by Job or Jobname(masks)
- Restrict the console operator from making the device available with a VARY device command
- Automatically replies to make the device available for an authorized Job or Jobname(masks)
- Automatically varies the device offline when the authorized Job or Jobname (mask) has completed
Time Controls

Management Summary

zOSEM Time Controls allow the installation to define and enforce rules for the amount of processor and waiting time allocated to jobs.

Improves throughput and service levels by preventing production re-runs due to exceeding JOB/Step time limits and preventing unauthorized jobs from consuming excessive amounts of CPU time or tying up resources waiting for others.

Details

Provide options for enforcing CPU time limitations, extending CPU time, Job wait time and TSO wait time by Jobclass, Jobname, Jobname mask, Program Name, Program Name mask, TSO userid, terminal id mask, days of the week or as defined in an external security system. Additionally, wait time can be extended for slow tape mounts, tape mount messages reissued to the operator console and notification messages sent to the operator console for tape mount failures. Time Controls protect Production Jobs from time exceeding abnormal terminations (S322 and S522 abends).

Dynamic STEPLIB Insertion

Management Summary

zOSEM Dynamic STEPLIB insertion facility allows you to dynamically insert, modify or replace STEPLIB concatenations during z/OS ATTACH processing prior to Programs starting during z/OS step initialization.

Assists in the migration to new versions of program products (e.g. LE/370) without JCL changes. Improves responsiveness to new requirements and avoids manual intervention for JCL changes.

Details

The Dynamic STEPLIB option allows you to modify or replace existing STEPLIB DD statements or to add a new STEPLIB DD based on Job Class, Job Name(mask), Userid (mask), Step Name or Program Name(mask). You may optionally fail the job if any of the specified libraries for the STEPLIB are unavailable, or allow the job to continue without changing the existing STEPLIB specification.
**Dynamic TSO STEPLIB**

Management Summary

*This function gives the ability to Dynamically change the TSO STEPLIB concatenation.*

**Details**

*The STEPLIB or any other ISPF DDNAME can be dynamically re-allocated based on an application requirements through the use of the zOSEM OS$LIB command in both a REXX EXEC or CLIST.*

**RACF Controls**

Management Summary

zOSEM RACF Controls allow you to dynamically update RACF security tables.

Improves system availability, service levels and responsiveness to new requirements by allowing the refresh of RACF objects without the need to restart the entire complex.

**Details**

Allows you to refresh the RACF ICHRIN03, ICHRDSNT and ICHRRCDE and ICHRFR01 tables without IPL.

**TSO Submitted JOB Controls**

Management Summary

zOSEM TSO submitted JOB Controls allow you to define and enforce installation standards for TSO submitted jobs.

Improves throughput and service levels by ensuring TSO jobs run in authorized execution classes and improves accountability by ensuring Jobname standards for TSO submitted jobs are respected.

**Details**

Allows you to:

- Enforce TSO submitted Jobs by Jobclass to be USERID of the submitting user
- Add NOTIFY parameter to TSO submitted Jobs by Jobclass
Control submission of MVS Commands and/or JES2 Commands embedded in Jobs by TSO users
Enhance NOTIFY information returning the highest return code from the job to the user
NOTIFY user at job start

**WTO Controls**

**zOSEM** WTO Controls allow monitoring of user specified Data Definition (DD) names for specific messages, to allow appropriate action by an automated operations package.

Provides potential to improve use of Human Resources by eliminating operator intervention.

**TAPE Sharing Controls**

**zOSEM** Tape Sharing Facility allows you to automatically share tape drives across systems without operator intervention.

- Eliminates operator responses for REPLY DEVICE NAME or CANCEL for shortage of tape drives
- Eliminates manual operator tasks
- Controls moving tape drives between LPARS or Sysplex(es)
- Manages scarce tape drive resources
- Controls hardware costs for tape drives
- Improves throughput and service levels by optimizing tape drive availability.

**JCL Parameter Controls**

**Management Summary**

**zOSEM** JCL Parameter Controls allow you to enforce JCL rules that control access to resources defined on JCL parameters.

- Improves throughput and service levels by controlling who has access to system resources
- Ensures valid accounting of used resources for capacity planning, service level reporting and charge-back
- Prevents misuse of resources and charging to the wrong user.
Details

Allows you to define and enforce, either using zOSEM or an external security system such as RACF, JCL rules that control access to resources defined on the following JCL parameters:

- Account number controls allow the account number field to be verified as valid and optionally resource checked utilizing an external security system such as RACF, ACF2 or TOPSECRET to ensure that a user has access to that account number.
- Job class controls cause RACF, ACF2 or TOPSECRET to resource check a Jobclass for user access.
- Job name controls cause zOSEM Environment Manager to determine if a Jobname has access to a Jobclass and/or certain Jobnames are excluded from a Jobclass.

SYSOUT controls check access to parameters including:
- SYSOUT Class
- FLASH
- CHAR
- FORM
- WRITER
- DESTINATION
- MSGCLASS
- FCB
- UCS
- Copy Mods for 3800

Tape Usage by JOBCLASS specifying maximum Total Tapes and/or Maximum by type of tape (e.g. 3420, 3480, 3490, 3590 and 3490-VTS)

Other JCL controls check access to parameters including:
- ADDRSPC
- PROTECT
- PERFORM
- SUBSYS
- DDNAMES
- DPRTY
- PRTY
Job/Step Statistics

Management Summary

zOSEM provides extensive information relating to jobs handled by the system. This can include an estimated charge for running the job.

Provides information for accounting and charge back and improves service to users by providing them with more information about job execution.

Details

zOSEM provides the following information relating to job execution:

- Enhanced NOTIFY returning the highest return code from the job to the user
- Job end WTO in JESLOG for highest step end condition code
- NOTIFY user when job starts
- Step end WTO in JESLOG with step condition code
- Step end statistics including I/Os by DDNAME in JES Messages
- Job end statistics in JES Messages
- Estimated job costs
- Customization of step end statistics flower box including Customer Description
- WTOR option by Jobclass for operator cancelled Jobs
- Highlighted WTO option by Jobclass for abended Jobs
- RACF, ACF2 or TOPSECRET support for TSO users to submit jobs with Jobnames other than their TSO userid prefix.
**HSM Optimization Controls**

**Management Summary**

**zOSEM** provides an easy to use DFSMSshsm (HSM) Optimizer that can dramatically improve performance in both SMS and non-SMS storage environments. The **zOSEM** HSM Optimizer:

- Reduces the manpower associated with managing HSM
- Improves use of hardware by reducing HSM CPU and I/O consumption
- Reduces the size of the ML1 Storage Pool
- Assists in reducing data set thrashing
- Improves throughput by ensuring production jobs have the highest priority for HSM recall and recovery activities

**Details**

The HSM Optimizer allows more precise control of HSM migration and backup. HSM, as supplied by IBM in both SMS and non-SMS environments, provides a limited set of specifications in determining which datasets will or will not be migrated or backed up. Complete volumes may be excluded, datasets may be excluded from migration and a residency factor (the number of days since last reference) may be specified. The HSM Optimizer in contrast, allows multiple residency specifications, the dataset size as a factor at migration time versus allocation time in DFSMS and a relationship between a dataset's size and specification in a dataset name list.

**zOSEM HSM Optimizer provides:**

- Prioritization of HSM recalls, recovers based on userid, Jobname, time of day, day of week and dsname (mask)
- Optionally recall datasets at JES2 Job conversion time and optionally prevent Job execution until the migrated datasets have been recalled
- A default DSORG for all datasets during allocation so that HSM can manage all datasets
- Global rules for Migration from Primary volumes to Migration Level 1 for SMS environments based on dataset size at migration time
- Global rules for Migration from Migration Level 1 to Migration Level 2 for SMS environments based on dataset size at migration time
Global rules for Direct Migration from Primary volumes to Migration Level 2 for SMS environments based on dataset size at migration time

Elimination of HSM Error messages by allowing simple lists of dataset name(s) or dataset name mask(s) to be entered for exception processing. i.e. Exclude dataset name(s) or dataset name mask(s) for datasets that are always open during HSM daily migration or backup processing

Automatic de-fragmentation of Primary volumes based on fragmentation index, time of day, day of week, and volume serial for non-SMS and SMS environments

Direct Migration from Primary volumes to Migration Level 2 based on dataset size and/or dataset name at migration time versus SMS at allocation time

Migration from Primary volumes to Migration Level 1 refused for datasets based on dataset size and/or dataset name at migration time versus SMS at allocation time

Migration from Migration Level 1 to Migration Level 2 refused for datasets based on dataset size and/or dataset name at migration time versus SMS at allocation time

Excluding of datasets from HSM back up in a non-SMS or SMS environment

Optimum Re-blocking of recalled datasets, and exclusion of datasets to be Re-blocked based on dataset size and/or dataset names

Residency specified at the dataset level for non-SMS environments

**Quick Delete**

**zOSEM** Quick Delete function specifies that any files coded with a retention setting of DELETE, the Dataset is migrated and the program name is IEFBR14 will be deleted by **zOSEM**. No HSM RECALL will be performed. Instead an HDELETE will be generated thereby avoiding wasting hardware resources on unnecessary recalls.
DASD Allocation Controls & QuickPool

Management Summary

zOSEM DASD Allocation Controls allow you to define and enforce DASD dataset allocation standards for non-VSAM datasets. QuickPool allows you to define and enforce dynamic pooling rules for non-VSAM datasets and for VSAM dataset placement.

Reduces storage and processing overhead. Provides a good bridge to DFSMS operations. Reduces effort to manage DASD storage. Provides accounting information at dataset and catalog level.

Details

The Control DASD allocation function controls whether:

- Absolute track allocation will be allowed
- Allocation requests for contiguous space will be honoured
- ALX allocation requests will be allowed
- MXIG allocation requests will be allowed
- Single-level dataset names will be allowed
- ISAM datasets will be allowed
- Unmovable datasets can be created
- RACF automatic dataset protection is in effect
- RACF discrete profiles are allowed

QuickPool provides dynamic pooling for non-VSAM datasets and enforces VSAM dataset placement as defined by the pooling rules. Specific features include:

- Dataset Name Standards enforcement
- Warn Mode with messages written in the JES log
- Dynamic masking for defining dataset name groups
- Dynamic masking for defining volume name groups
- DFSMS migration aid
- Makes DASD usage information available for accounting purposes by storing account number information into the Format1 DSCB for non-VSAM files
HSM Reports

Management Summary

zOSEM provides an extensive set of reports that help to maintain error free migration and recall operations in the SMS storage environment. Reports detail the performance of the HSM component in non-DFSMS and DFSMS environments. With zOSEM HSM reports, you can reduce the manual effort for storage management activities. They allow storage management personnel to quickly gain an insight into HSM operations and helps them to be more responsive to user requirements.

Details

The HSM SMF Function Statistic Records (FSR), Volume Statistic Records (VSR), Daily Statistic Records (DSR), Migration Control Dataset (MCDS), Backup Control Dataset (BCDS) and HSM Primary Volume VTOCS are utilized. A database of the latter records is maintained to provide both daily and historical reporting. Specific features and reports include:

Dynamic date selection

- Summary and Detail HSM Error Reports by Function, Return and Reason code
- Dataset Activity Report details excessive Migration and Recall of datasets
- Primary Volume Summary Report:
  - Available space
  - Space releasable
  - Last Backup date/time
  - Last Migration date/time
  - Last Dump date/time
  - Summary of volume utilization by DSORG
  - Type of Volume SMS or HSM

- Primary Volume Detail Report:
  - Dataset Name
  - DSORG
  - Type of allocation (CYL, TRK, Megabytes, Kilobytes)
  - Space allocated
  - Space used
  - Space releasable
  - Number of extents
  - DFSMS managed

- Activity Summary Report utilizing the DSRs for the reporting period:
  - Number of datasets migrated to ML1 and ML2
- Number and percent of datasets that failed migration to ML1 and ML2
- Number of datasets recalled from ML1 and ML2
- Number and percent of datasets that failed recall from ML1 and ML2
- Number of datasets backed up
- Number and percent of datasets that failed backup

**Volume Summary Report utilizing the VSRs for the reporting period:**
- Volume Utilization including minimum, maximum and average
- Fragmentation Index including minimum, maximum and average
- Number of datasets migrated
- Number of datasets recalled
- Number of datasets backed up
- Number of datasets recovered
- Date/time of last volume dump

**Detail Dataset Movement Reports:**
- Primary to ML1
- ML1 to ML2
- Primary to ML2
- ML1 to Primary
- ML2 to Primary

**Summaries of Dataset movement by size and age of dataset:**
- Primary to ML1
- ML1 to ML2
- Primary to ML2
- ML1 to Primary
- ML2 to Primary

**Summary and Detail Reports on Migration Control Dataset (MCDS) by Age**

**Summary and Detail Reports on Backup Control Dataset (BCDS) by Age**

**ISPF Interface for all report specifications**
Answering your questions
While reviewing this evaluation guide, please don't hesitate to contact us if you require further explanations or have any questions at all about zOSEM.

Arranging a presentation
zOSEM can be presented at a location of your choosing to selected individuals or groups by Trident Services, Inc. zOSEM is of potential interest to the people responsible for the following IBM mainframe areas in your organization:

- Production
- Technical Support
- Software Licenses
- Storage Management
- Capacity Planning
- Performance
- Service Levels
- Accounting & Charge-back

The presentation is designed to provide you and your organization with a high-level overview of the basic concepts of zOSEM and the different ways that it can be used to improve the efficiency and cost effectiveness of your z/OS platforms.

Arranging a demonstration
A live demonstration of zOSEM can be given for those who require a more in-depth understanding of how the zOSEM interface works and can be tailored to cover areas of specific interest.

Please contact our office:

Trident Services, Inc.,
1260 41st Avenue, Suite K,
Capitola, CA 95010
